h j beyer and h kleinpoppen during the preparation of parts a and b of progress in atomic spectroscopy a few years ago it soon became obvious that a comprehensive review and description of this field of modern atomic physics could not be achieved within the limitations of a two volume book while it was possible to include a large variety of spectroscopic methods inevitably some fields had to be cut short or left out altogether other fields have developed so rapidly that they demand full cover in an additional volume one of the major problems already encountered during the preparation of the first volumes was to keep track of new developments and approaches which result in spectroscopic data we have to look far beyond the area of traditional atomic spectroscopy since methods of atomic and ion collision physics nuclear physics and even particle physics all make important contributions to our knowledge of the static and dynamical state of atoms and ions and thereby greatly add to the continuing fascination of a field of research which has given us so much fundamental knowledge since the middle of the last century in this volume we have tried to strike a balance between contributions belonging to the more established fields of atomic structure and

spectroscopy and those fields where atomic spectroscopy overlaps with other areas

since the publication in 1950 of vol i spectra of diatomic molecules of molecular spectra and molecular structure much progress has been made in the field while there have been some important refinements in the theory of diatomic molecular spectra most of the advances have been in the further exploration of individual spectra not only has the number of molecules about which some spectroscopic data are available been increased by a factor of 2 to 3 but also the spectroscopic information about the molecules known in 1950 has been vastly extended this is due to the observation of new electronic states about three times as many as known before the enormous improvements in the accuracy of the constants of the states known in 1950 and the determination of higher order constants in view of the increasing use of spectroscopic information on diatomic molecules in other fields of physics in chemistry and in astrophysics it appeared desirable to prepare an up to date version of the table of molecular constants in the appendix of vol i this updating proved to be far more time consuming than originally anticipated and it is only now 10 years that we are able to present such a table which instead after its initiation of the original 80 pages plus 30 pages of bibliography now fills a volume of 700 pages in the interest of economy and unlike the original version the new table has been produced by photo offset from the final manuscript
